

MOOVU INTERNAL PRODUCT DOCUMENT

MOOVU System Design & Product Specification

Complete Product, Business and
Technical Overview

PURPOSE

This document explains what MOOVU is, how it works, how customers, drivers and administrators use it, how rides move through the system, and how the business earns and governs transport operations.

LOCAL TOWNSHIP RIDES

Your local ride, just a few taps away.

Book safe, reliable local trips with nearby MOOVU drivers, OTP trip starts, live updates and clear receipts.

Verified drivers OTP starts Receipts

HOW MOOVU WORKS

A guided ride flow from request to receipt.

1 Enter pickup and destination

2 Choose MOOVU Go or Go XL

3 Confirm your ride

4 Track your driver and ride safely

TRUST AND SAFETY

Built for confident local movement.

Verified local drivers

See driver, vehicle and plate details after acceptance.

OTP-protected trip starts

Trips start only after the correct rider OTP is confirmed.

Live driver tracking

Follow your driver and ride progress from pickup to destination.

Clear trip receipts

Access your completed trip receipt after the ride.

Cash-friendly local rides

Built around the way local township trips are taken.

Driver details before pickup

Confirm the car and driver before getting into the vehicle.

SERVICE AREAS

Focused on Siyabuswa and nearby local travel.

MOOVU is growing around Siyabuswa, KwaMhlanga, KwaNdebele nearby areas, and everyday township travel routes. Availability may vary as the driver network expands.

transport
technology

MOOVU System Design & Product Specification

Organisation: MOOVU

Product category: Ride-hailing and local transport technology

Version: 1.0

Generation date: 6 August 2026

This document is intended to help management, partners, investors, designers, developers, testers, support staff and driver-onboarding staff understand the current MOOVU product and operations model.

- Product sections explain what each application surface does.
- Business-process sections explain how money, eligibility and review flows work.
- User-flow sections explain customer, driver and admin movement through the product.
- Technical sections explain how the platform coordinates data, notifications and controls.
- Operational sections explain how MOOVU runs as a real transport system.

Report navigation

-
- 1. Executive Summary** MOOVU is a multi-sided ride-hailing platform built around township and local-community transport. It combines a customer booking experience, a driver operations system, and an admin control center that govern booking, dispatch, payments, subscriptions, receipts, OTP verification, and operations.
-
- 2. MOOVU Brand and Product Identity** The live application uses a blue-led palette, strong white surfaces, aqua and sky accents, and a taxi-branded MOOVU mark. The brand language emphasizes trust, local reliability, clarity, and smartphone-first usability.
-
- 3. What MOOVU Is** MOOVU is a ride-hailing and operations platform that coordinates customers, drivers, subscriptions, dispatch, finance and oversight in one system.
-
- 4. Problem and Market Context** MOOVU is designed for local township and peri-urban transport conditions where dependable short-distance movement, safety confidence, operational oversight, and practical cash-friendly ride management matter.
-
- 5. MOOVU Business Model** MOOVU earns from customer trip pricing, driver subscriptions, and trip commission. Finance is mediated through admin-reviewed proof-of-payment flows and auditable wallet or receipt records.
-
- 6. Platform Users and Roles** MOOVU separates public, customer, driver, and admin activity through role-specific pages, account linking, and server-validated access control.
-
- 7. MOOVU Platform Overview** The platform spans public web entry, customer and driver route domains, an admin control system, native shells, server APIs, Supabase, Google Maps and Firebase-backed notification delivery.
-
- 8. Complete Customer Journey** The customer lifecycle begins with account access and location setup, moves through fare estimation and driver search, and ends with OTP-protected completion, receipt access, and rating.
-
- 9. Customer Screen Catalogue** Customer screens cover public entry, authentication, booking, active ride handling, account management and legal support.
-

10. Driver Onboarding Journey

MOOVU System Design & Product Specification

October 2026

Driver onboarding is a guided multi-step process that captures eligibility, account details, identity data, document requirements, vehicle details, and review submission.

11. Driver Documents

MOOVU models driver identity, licence, compliance, and vehicle records as private reviewed documents with operational consequences for readiness and trust.

12. Driver Eligibility

Receiving trips is contingent on account approval, subscription status, commission balance, live GPS, availability, and ride-capacity compatibility.

13. Driver Subscription System

Drivers pay one of three subscription plans, upload proof of payment, wait for admin approval, then receive activated operating access according to the selected duration.

14. Driver Application and Operations

After approval, a driver uses the portal to go online, receive trip offers, reach pickup, verify start OTP, navigate, complete the trip with end OTP, and review earnings and balances.

15. Driver Screen Catalogue

Driver-facing screens cover onboarding, live operations, history, earnings, subscriptions, commission payments, support, account control and deletion.

16. Admin Operations Overview

MOOVU administrators supervise the platform operationally: onboarding, trip oversight, dispatch, payment review, subscriptions, commissions, receipts and reporting all pass through the admin surface.

17. Admin Screen Catalogue

Admin screens span operations, customers, drivers, payments, reports and system notifications. The navigation structure itself reflects MOOVU's business operations model.

18. Complete Trip Lifecycle

Trips move through explicit lifecycle states, with audit events, offer state, OTP milestones, fare finalization and completion records.

19. Driver Dispatch and Matching

Dispatch is a scored, eligibility-aware, time-boxed candidate search that uses explicit driver filters, radius logic, and an atomic acceptance process to prevent duplicate assignment.

20. Fare and Pricing System

MOOVU System Design & Product Specification

1.0 • 6 August 2026

Fare calculation is centralized around ride-option rules, booking fee, distance, duration, surge, waiting, stop logic, minimum fare and final-trip adjustment.

21. Maps and Live Location

MOOVU combines customer location selection, Google Maps geocoding and routing, and driver heartbeat updates to drive booking, dispatch, route display and completion checks.

22. OTP and Trip Security

Start and end OTP checkpoints give MOOVU a practical trip-security layer that aligns start, trip progression and completion with explicit rider validation.

23. Notifications and Realtime Updates

MOOVU stores push delivery targets across web, Android and iOS, sends server-side visible notifications through Firebase or Web Push, and routes users back into the correct portal.

24. Driver Earnings and MOOVU Commission

Completed trips generate gross fare, driver net, and MOOVU commission entries that flow into the wallet and settlement system.

25. Payments and Subscription Reviews

Driver payments are proof-based, typed as subscription, commission or combined, and require admin review before they affect subscription state or commission balance.

26. Receipts and Records

Receipts are customer-facing trip records and admin-visible financial evidence surfaces. The platform also preserves structured trip and payment history for audit and support.

27. Authentication and Access Control

MOOVU uses Supabase authentication, customer or driver profile linking, admin role checks, protected routes and account deletion flows to keep each portal bounded.

28. MOOVU Information Model

The MOOVU database is not just a storage layer. It is a direct model of customers, drivers, trips, offers, subscriptions, wallet state, payments, receipts and notification routes.

29. API Capability Catalogue

Business capabilities are implemented as customer, driver, admin, maps, notification and supporting server routes. Each capability is validated server-side rather than trusting client intent.

30. How the Applications Work Together

MOOVU System Design & Product Specification

Customer, server, database, dispatch, notifications, driver and admin logic are synchronized through explicit server-side mutations and event-driven messaging.

1.0 - 6 August 2026

31. Safety and Trust MOOVU's trust model is built from approval, documentation, OTP checkpoints, visibility, audit trails, support and controlled operator readiness rather than a single isolated safety feature.

32. Support and Exception Handling The platform explicitly handles declines, no-driver outcomes, invalid OTP, expired subscriptions, payment rejection, GPS loss, active-trip restrictions and notification-denied states.

33. Product Differentiators MOOVU's strongest product differentiators are operational, local and commercially structural rather than cosmetic.

34. Feature Maturity Scorecard The scorecard below reflects implementation completeness, not commercial scale or market traction.

35. Confirmed, Partial and Runtime-Dependent Capabilities Some capabilities are confirmed directly from source and surrounding documentation, while others depend on environment, migration or real-device verification.

36. Intended Versus Implemented Behaviour The platform contains a small number of business-rule or naming mismatches that should be tracked explicitly rather than obscured.

37. Operational Playbooks The operating model is practical and role-driven. Each recurring operational scenario has a clear owner and result.

38. Glossary These terms are central to understanding how MOOVU behaves as a product and business system.

39. What MOOVU Currently Does MOOVU currently provides a full booking-to-operations cycle that joins customer requests, driver execution and admin oversight.

40. How MOOVU Does It The platform works by coordinating structured web and native-ready interfaces with server-side validation, stored records, and timed operational logic.

41. MOOVU Explained from Beginning to End

MOOVU System Design & Product Specification

The sequence below explains the whole operating system in one continuous narrative.

1.0 • 6 August 2026

Appendices A–H Pricing, eligibility, documents, subscriptions, status, notifications, permissions and admin checklists.

1. Executive Summary

MOOVU is a multi-sided ride-hailing platform built around township and local-community transport. It combines a customer booking experience, a driver operations system, and an admin control center that govern booking, dispatch, payments, subscriptions, receipts, OTP verification, and operations.

OPERATIONAL MODEL

**Admin-reviewed,
locally managed
transport network**

MOOVU is more than a simple booking website. The customer side creates and tracks trips, the driver side controls readiness and trip execution, and the admin side supervises operations, onboarding, finance, and exceptions. That combination makes MOOVU a full service operations platform rather than a single-view application.

The business model combines customer fares, driver subscriptions, commission controls, cancellation and no-show handling, proof-of-payment reviews, and receipt records. The product is designed for real-world local transport operations rather than a demonstration booking form.

Customer-facing MOOVU landing screen showing the app-style entry experience.

2. MOOVU Brand and Product Identity

The live application uses a blue-led palette, strong white surfaces, aqua and sky accents, and a taxi-branded MOOVU mark. The brand language emphasizes trust, local reliability, clarity, and smartphone-first usability.

BRAND PALETTE

The platform consistently uses a cool blue primary, clean white cards, soft sky backgrounds, and aqua support accents. This creates a branded look that feels premium while remaining practical for daily use in customer, driver, and admin surfaces.

BRAND ASSETS

The visual identity carries taxi symbolism, locality, and directness. It is positioned as a serious transport utility rather than a decorative consumer lifestyle brand.

3. What MOOVU Is

Public definition: MOOVU is a local ride-booking platform that lets people request safe nearby transport, track a driver, verify the trip with OTP, and receive a clear receipt afterward.

Business definition: MOOVU is a managed transport marketplace where the business controls who can operate, how drivers pay subscriptions and commission, and how trips, receipts, and support cases are supervised.

Technical definition: MOOVU is a multi-surface web and mobile-ready system built on Next.js, Supabase, Google Maps, Firebase messaging, and Capacitor. It combines customer booking, driver readiness, admin oversight, push notifications, storage-backed uploads, and finance workflows.

- Ride-hailing platform: customers request rides and drivers complete them.
- Booking system: customer input becomes a structured trip record.
- Driver-management system: onboarding, subscriptions, readiness, GPS and earnings are managed.
- Dispatch platform: eligible drivers are scored and offered trips in timed cycles.
- Subscription platform: drivers pay daily, weekly, or monthly access fees.
- Commission and settlement platform: completed trips create commission due and admin-reviewed settlements.
- Operations control system: admin users supervise trips, applications, receipts, dispatch and payments.
- Multi-sided marketplace: customers, drivers and MOOVU operations interact through one system.

4. Problem and Market Context

MOOVU System Design & Product Specification

1.0 • 6 August 2026

MOOVU is designed for local township and peri-urban transport conditions where dependable short-distance movement, safety confidence, operational oversight, and practical cash-friendly ride management matter.

For customers, the core problem is simple: transport must be requestable, visible, and safe enough to trust. MOOVU answers that with live driver matching, clear fare display, driver identity visibility, OTP-protected start and completion, receipts, and support surfaces.

For drivers, the problem is different: they need a controlled route into earning, predictable operating rules, visibility into commission owed, a clear subscription system, and a trip flow that protects them against ambiguous starts and ends. MOOVU addresses those needs with onboarding review, readiness checks, OTP validation, earnings summaries, and wallet-based commission tracking.

Problem to solution map

Problem to solution map

5. MOOVU Business Model

MOOVU System Design & Product Specification

1.0 • 6 August 2026

MOOVU earns from customer trip pricing, driver subscriptions, and trip commission. Finance is mediated through admin-reviewed proof-of-payment flows and auditable wallet or receipt records.

INCOME CHANNEL	HOW IT WORKS	OPERATIONAL NOTE
Customer fares	Customers see an estimate at booking and a final trip amount after completion logic finalizes the trip.	Finalization allows fare adjustment after actual route conditions.
Driver subscriptions	Drivers select daily, weekly, or monthly access and upload proof of payment.	Admin approval activates the selected plan.
Trip commission	Completed trips create MOOVU commission due against the driver wallet.	Drivers are blocked from going online when due exceeds R100.
Cancellation and no-show fees	Applicable fees are recorded separately from normal trip commission.	Fee splits are fixed between driver and MOOVU.

Business rule requiring confirmation: the codebase contains both a legacy fallback commission constant of 9.5% and ride-option commission rules of 10% for MOOVU Go and 12% for MOOVU Go XL. The report treats that as a confirmed mismatch rather than a hidden assumption.

MOOVU money flow

6. Platform Users and Roles

MOOVU System Design & Product Specification

1.0 • 6 August 2026

MOOVU separates public, customer, driver, and admin activity through role-specific pages, account linking, and server-validated access control.

	PRIMARY PERMISSION	
Visitor	Can access public landing, legal pages, and customer or driver entry points	No trip or protected data access
Customer	Can create bookings, track trips, use OTP, chat, rate, and view receipts	Cannot access driver or admin operations
Driver applicant	Can create a driver account and submit onboarding data	Cannot receive trips until approved and eligible
Approved driver	Can log in, go online, receive offers, execute trips, and manage earnings	Cannot use admin operational tools
Administrator	Can review trips, drivers, receipts, and payments	Requires approved admin role in profiles table
Dispatcher	Operational dispatch visibility and intervention	Subset of admin roles
Support	Operational and customer support visibility	Subset of admin roles
Payment reviewer	Reviews subscription, commission and combined driver payments	Admin-protected workflow
Owner	Highest administrative authority	Role-based, not separate app surface

Admin permissions are not free-form. They are resolved from the profile role set accepted by the application: owner, admin, dispatcher and support. Driver ownership is not inferred from client claims; it is resolved through an explicit driver account link table.

7. MOOVU Platform Overview

MOOVU System Design & Product Specification

The platform spans public web entry, customer and driver route domains, an admin control system, native shells, server APIs, Supabase, Google Maps and Firebase-backed notification delivery.

1.0 • 6 August 2026

Customer, driver and admin traffic can be partitioned by route and by host. Middleware rewrites admin and driver subdomains into the relevant application path. That means the system can present separate branded portals while sharing one application backend.

The customer iOS shell uses the customer bundle identifier and the driver iOS shell uses the driver bundle identifier. Each shell points to its own route domain. The Android and iOS shells are packaging layers on top of the same web application logic.

8. Complete Customer Journey

MOOVU System Design & Product Specification

1.0 • 6 August 2026

The customer lifecycle begins with account access and location setup, moves through fare estimation and driver search, and ends with OTP-protected completion, receipt access, and rating.

Customer journey

Customer journey

The customer can request the current location, paste or search locations, adjust pickup on a map, add up to two stops, and choose MOOVU Go or MOOVU Go XL. Pricing is shown before booking and recalculated server-side so the backend does not trust client fare input.

After a driver accepts, the customer sees assigned-driver information, trip status changes, OTP state, chat access, and final actions such as receipt and rating. Account deletion and legal surfaces are also part of the live customer experience.

Customer authentication surface used before booking when no active session exists.

9. Customer Screen Catalogue

MOOVU System Design & Product Specification

1.0 • 6 August 2026

Customer screens cover public entry, authentication, booking, active ride handling, account management and legal support.

Landing page	App-style entry screen, booking CTA, trust panels, driver application CTA	Visitor / customer
Customer authentication	Phone, email and password-based access to customer account	Visitor
Booking page	Pickup, destination, stops, ride option, fare estimate, notifications, booking submit	Customer
Ride history	Previous trips, receipt access, rating links	Customer
Active trip	Assigned driver, fare state, OTP state, chat, final actions	Customer
Receipt	Trip proof with fare and ride details	Customer
Rating	Post-trip rating flow	Customer
Account and security	Profile and account security surfaces	Customer
Delete account	Apple-compliant in-app deletion flow	Customer
Privacy, terms and contact	Legal and support surfaces	Visitor / customer

Driver onboarding

MOOVU • Customer • Driver • Dispatch • Operations

The onboarding surface intentionally separates required documents from optional or later-stage operational documents. A driver can submit while PDP or PrDP is still pending because the current business rule tracks the status without making it an unconditional application blocker.

Vehicle and identity validation are already opinionated. The application enforces basic format checks for items such as South African ID number, VIN, engine number, seating capacity, and vehicle registration structure.

1. Eligibility

2. Account

3. Personal

ELIGIBILITY CHECK

These questions help MOOVU understand whether you are ready now or need follow-up before operating.

Are you 18 years or older?

Yes

No

Do you have a valid driver licence?

Do you have a PDP / PrDP?

Yes, I have one

No, not yet

I am applying for one

Do you have access to a 4-door roadworthy vehicle?

Enable Notifications

Driver onboarding application with readiness tracking and step-based flow.

MOOVU • Customer • Driver • Dispatch • Operations

0

11. Driver Documents

SA ID or passport	Identity verification and account legitimacy	Yes	Required to verify the driver applicant
Driver licence	Driving eligibility	Yes	Required to operate
Proof of residence	Local compliance and contact confidence	Yes	Required for onboarding review
Profile photo	Rider-facing trust and identity	Yes	Supports driver trust display
PDP / PrDP	Professional transport readiness	Tracked, not always blocking	May be requested before full operations
Vehicle registration	Vehicle ownership and lawful operation	Yes	Vehicle validation
Licence disc	Road legality	Yes	Vehicle validation
Roadworthy certificate	Operational safety confidence	Yes	Vehicle validation
Vehicle insurance	Risk and compliance context	Optional where available	Improves operational confidence
Vehicle photos	Physical vehicle review and rider trust	Expected	Visual verification
Police clearance	Optional safety strengthening	Optional	Enhanced safety review when present
Transport permit	Optional commercial operation support	Optional	Context-dependent

12. Driver Eligibility

MOOVU System Design & Product Specification

Receiving trips is contingent on account approval, subscription status, commission balance, live GPS, availability, and ride-capacity compatibility.

1.0 • 6 August 2026

Driver eligibility decision path

MOOVU • Customer • Driver • Dispatch • Operations

Driver eligibility decision path

0

Vehicle capacity logic currently contains a naming mismatch. Operationally, the fare system presents MOOVU Go XL, while the seating-capacity helper still refers to Go Plus for seven-seat review paths. The eligibility rule itself is still clear: the larger ride category requires higher capacity and may require admin review depending on the vehicle record.

13. [MOOVU]ver Subscription System

MOOVU System Design & Product Specification

Drivers pay one of three subscription plans, upload proof of payment, wait for admin approval, then receive activated operating access according to the selected duration.

1.0 • 6 August 2026

PLAN	AMOUNT	DURATION
Daily	R45	1 day
Weekly	R100	7 days
Monthly	R250	30 days

Subscription approval is not automatic. The driver submits a payment request, an admin reviews the proof of payment, and only then does the driver record update to active status with the correct expiry window. That keeps plan activation tied to reviewed proof rather than a client-side claim.

Subscription lifecycle

Subscription lifecycle

14. Driver Application and Operations

MOOVU System Design & Product Specification

After approval, a driver uses the portal to go online, receive trip offers, reach pickup, verify start OTP, navigate, complete the trip with end OTP, and review earnings and balances.

The driver portal is both an operational cockpit and a compliance gate. Online state depends on subscription validity, commission balance, and location freshness. Trip actions are then constrained again by arrival radius, OTP rules, minimum trip duration, and destination-area completion tolerance.

Driver sign-in surface for the operational portal.

15. Lower Screen Catalogue

MOOVU System - User's Product Specification

1.0 • 6 August 2026

Driver-facing screens cover onboarding, live operations, history, earnings, subscriptions, commission payments, support, account control and deletion.

DRI SCREEN	PURPOSE	PRIMARY USER
Driver login	Separate driver sign-in surface and route domain	Driver
Driver application	Guided multi-step onboarding	Applicant
Driver home	Online status, offer state, GPS, live trip actions	Approved driver
Trip offers	Offer reception, countdown, accept or decline	Online driver
Driver history	Past trip list and filters	Driver
Driver earnings	Gross, net, commission and wallet summaries	Driver
Driver subscriptions	Plan selection and proof of payment submission	Driver
Driver commission payments	Commission payment to MOOVU with POP upload	Driver
Driver account	Identity, documents, quick actions	Driver
Delete account	In-app account deletion flow	Driver

Not every driver surface is publicly screenshot-safe, because some pages depend on active linked driver identities or financial records. Where real authenticated content is not safely includable, this report treats the screen catalogue as a factual operational inventory rather than a visual mockup.

16. Admin Operations Overview

MOOVU System Design & Product Specification

1.0 • 6 August 2026

MOOVU administrators supervise the platform operationally: onboarding, trip oversight, dispatch, payment review, subscriptions, commissions, receipts and reporting all pass through the admin surface.

Typical admin day

Typical admin day

MOOVU • Customer • Driver • Dispatch • Operations

0

The admin role is not only a back-office reporting view. It is a live operational control surface with trip visibility, dispatch context, driver review, receipt access, and payment approvals that immediately affect eligibility and driver platform access.

17. Admin Screen Catalogue

MOOVU System Design & Product Specification

1.0 • 6 August 2026

Admin screens span operations, customers, drivers, payments, reports and system notifications. The navigation structure itself reflects MOOVU's business operations model.

ADN MOOVU CREEN /U System Purpose Product Specification			PRIMARY USER
Admin dashboard	Operational overview and KPI summaries		Administrator
Trips	Trip list and detail review		Administrator / support
Dispatch board	Live trip assignment and intervention		Dispatcher
Dispatch map	Geographic operational view		Dispatcher
Drivers	Driver directory, status and profile management		Admin
Applications	Driver onboarding review queue		Admin
Payment reviews	Subscription, commission and combined payment review		Payment reviewer
Subscriptions	Subscription management and approval workflow		Payment reviewer
Commission payments	Commission settlement management		Payment reviewer
Receipts	Trip and payment receipt access		Admin / support
Reports and earnings	Operational and financial reporting		Admin / owner
Notifications	Admin-side notification surface		Admin

1.0 • 6 August 2026

Admin sign-in screen for operations access.

Trip status lifecycle

STATUS	MEANING
scheduled	Trip is booked for future release.
requested	Immediate trip created and ready for dispatch.
offered	Trip offer is active in the dispatch process.
assigned	A driver has accepted the trip.
arrived	Driver has reached pickup.
ongoing	Trip has started after OTP verification.
completed	Trip has ended and fare is finalized.
cancelled	Trip ended without successful completion.

19. [MOOVU] Driver Dispatch and Matching

Dispatch is a scored, eligibility-aware, time-boxed candidate search that uses explicit driver filters, radius logic, and an atomic acceptance process to prevent duplicate assignment.

DISPATCH SETTING	CURRENT IMPLEMENTATION
Offer window	25 seconds
Escalation cadence	25-second rounds
Initial radius	8 km
Expanded radius	20 km
Maximum cycles	3
Maximum search time	180 seconds in code
GPS freshness	90 seconds

Candidate ranking is not distance-only. The selection code combines distance, driver quality, acceptance behaviour, recent offer rotation and missed-offer penalties, then filters out busy, stale, declined, ineligible or already-offered drivers. That gives MOOVU an operationally rational dispatch basis rather than a naive nearest-only search.

20. Fare and Pricing System

MOOVU System Design & Product Specification

1.0 • 6 August 2026

Fare calculation is centralized around ride-option rules, booking fee, distance, duration, surge, waiting, stop logic, minimum fare and final-trip adjustment.

RIDER TYPE	MOOVU SYSTEM	CAPACITY	BASE FARE	BOOKING FEE	MINIMUM	PER KM	PER MINUTE	WAITING	COMMISSION
MOOVU Go		Up to 3 riders	R15	R4	R40	R9/km	R1.50/min	R2/min after 3 free minutes	10%
MOOVU Go XL		Up to 6 riders	R25	R5	R70	R12/km	R2.00/min	R3/min after 3 free minutes	12%

Distance-tier discounts are applied after surge and before minimum fare rounding. Stops are capped at two and use a discounted add-stop increase model instead of a full raw route increase. Final customer price is recalculated at completion so the last known trip route and any stop adjustments can influence the final fare.

Fare calculation pipeline

21. Maps and Live Location

MOOVU combines customer location selection, Google Maps geocoding and routing, and driver heartbeat updates to drive booking, dispatch, route display and completion checks.

22. C and Trip Security

Start and end OTP checkpoints give MOOVU a practical trip-security layer that aligns start, trip progression and completion with explicit rider validation.

The security model also includes start-state checks, minimum trip duration logic, completion distance tolerance, and explicit admin or bypass handling. That means OTP is not a decoration; it is wired into trip-state control and audit history.

23. Notifications and Realtime Updates

MOOVU System Design & Integration Specification

MOOVU stores push delivery targets across web, Android and iOS, sends server-side visible notifications through Firebase or Web Push, and routes users back into the correct portal.

1.0 • 6 August 2026

EVENT	CUSTOMER	DRIVER	ADMIN	DELIVERY	DESTINATION

Driver earnings and receipts

24. Driver Earnings and MOOVU Commission

MOOVU System Design & Product Specification

1.0 • 6 August 2026

Completed trips generate gross fare, driver net, and MOOVU commission entries that flow into the wallet and settlement system.

Commission and driver net flow

Commission and driver net flow

Wallet state is not cosmetic. It directly affects whether a driver can continue going online. The threshold is currently R100 due, after which the driver may still log in and submit payment but is restricted from taking more trips until settlement reduces the balance.

25. Payments and Subscription Reviews

Driver payments are proof-based, typed as subscription, commission or combined, and require admin review before they affect subscription state or commission balance.

26. Receipts and Records

Receipts are customer-facing trip records and admin-visible financial evidence surfaces. The platform also preserves structured trip and payment history for audit and support.

27. Authentication and Access Control

MOOVU System Design & Product Specification

1.0 • 6 August 2026

MOOVU uses Supabase authentication, customer or driver profile linking, admin role checks, protected routes and account deletion flows to keep each portal bounded.

Customer	Supabase session and bearer token	Customer record linked by auth user
Driver	Supabase session and bearer token	Driver account maps auth user to driver ID
Admin	Supabase session and bearer token	Profiles role must be one of accepted admin roles
Account deletion	Password re-verification and DELETE confirmation	Blocks active trip deletion

The MOOVU database is not just a storage layer. It is a direct model of customers, drivers, trips, offers, subscriptions, wallet state, payments, receipts and notification routes.

Information Model

ENTITY	REPRESENTS	WORKFLOW DEPENDENCY
Customers	Customer profile and authenticated rider identity	Auth-linked account, bookings, receipts, ratings
Drivers	Operational driver profile and live availability	Eligibility, dispatch, earnings, subscriptions
Driver accounts	Links auth users to driver records	Ownership checks
Driver applications	Pre-approval onboarding submissions	Admin review queue
Driver documents	Driver document metadata and review status	Eligibility and compliance
Trips	Ride booking and lifecycle record	Core transaction and dispatch anchor
Trip events	Lifecycle audit trail	Support, audit, OTP and dispatch history
Driver trip offers	Offer queue for staged dispatch	Offer state and atomic acceptance
Driver wallets	Commission due, totals and account status	Eligibility lock and financial reporting
Driver settlements	Commission payments received	Balance reduction and audit
Driver payment requests	Subscription or commission proof submissions	Admin review workflow

MOOVU • Customer • Driver • Dispatch • Operations

0

ENTITY	REPRESENTS	WORKFLOW DEPENDENCY
 MOOVU System Design & Product Specification Driver subscription payments	Approved subscription payment records	1.0 • 6 August 2026 Subscription activation history
Driver subscription events	Subscription timeline and admin actions	Lifecycle history
Trip cancellation fees	Late cancellation and no-show ledger	Customer fee handling
Trip messages	Customer-driver live chat messages	Accepted trip messaging
Trip ratings	Post-trip rating records	Experience and quality tracking
Push subscriptions	Legacy web push subscription records	Browser push delivery
FCM tokens	Device token registry across web, Android and iOS	Push routing
App pricing settings	Server-controlled pricing settings such as manual surge	Operational pricing control

29. Capability Catalogue

MOOVU System Design & Product Specification

1.0 • 6 August 2026

Business capabilities are implemented as customer, driver, admin, maps, notification and supporting server routes. Each capability is validated server-side rather than trusting client intent.

CAPABILITIES

Customer	Register, authenticate, create trip, estimate route, track trip, cancel trip, add stop, rate trip, view history, view receipt, delete account, register notifications
Driver	Apply, upload documents, update location, go online, receive offers, accept or decline, mark arrived, start trip, complete trip, view history, view earnings, submit payment, view subscription, view commission, delete account
Admin	Authenticate, review applications, inspect documents, monitor trips, dispatch or re-offer, review payments, manage subscriptions, view receipts, manage reports and notifications

How the Applications Work Together

Customer, server, database, dispatch, notifications, driver and admin logic are synchronized through explicit server-side mutations and event-driven messaging.

31. Safety and Trust

- Driver approval before operational access
- Document review and vehicle evidence
- Driver and vehicle identity surfaces
- Start OTP and end OTP
- Trip event audit trail
- Admin visibility into lifecycle and payments
- Customer-driver chat after driver acceptance
- Location-based trip execution rules
- Account deletion and legal support surfaces

32. Support and Exception Handling

MOOVU System Design & Product Specification

1.0 • 6 August 2026

The platform explicitly handles declines, no-driver outcomes, invalid OTP, expired subscriptions, payment rejection, GPS loss, active-trip restrictions and notification-denied states.

No drivers available	Trip remains unassigned and dispatch cycles continue until search is exhausted or trip is cancelled.
Driver declines	Next dispatch attempt is triggered and decline is recorded.
Driver ignores offer	Offer expires and the cycle can progress.
Invalid OTP	Start or completion action is rejected.
Driver loses GPS freshness	Eligibility or trip guard can fail until heartbeat recovers.
Expired subscription	Driver cannot operate until plan is active again.
Excessive commission due	Driver cannot go online while balance due is at or above threshold.
Failed payment upload	Driver payment request is rejected before submission.
Notification permission denied	In-app flow continues, but push delivery is unavailable.

Differentiators

MOOVU's strongest product differentiators are operational, local and commercially structural rather than cosmetic.

- Township and local-community route focus instead of generic nationwide framing.
- Subscription plus commission model for drivers.
- OTP at both trip start and trip completion.
- Admin-reviewed payment-proof operations rather than blind client claims.
- Locally managed driver onboarding with document and vehicle emphasis.
- Operations-centered admin portal rather than a minimal report-only back office.

34. Future Maturity Scorecard

MOOVU System Design & Product Specification

1.0 • 6 August 2026

The scorecard below reflects implementation completeness, not commercial scale or market traction.

Customer accounts		Solid account, legal acceptance and deletion flow are present.
Customer booking		Core ride request flow is implemented with fare logic, stops and surge.
Fare calculation		Centralized fare rules exist, with finalization and stop-aware adjustments.
Driver onboarding		Multi-step guided application is implemented, with review hooks.
Driver documents		Document model exists; runtime depends on bucket and policy alignment.
Driver subscriptions		Plan pricing, review flow and activation logic exist.
Driver eligibility		Eligibility checks are explicit across subscription, balance and vehicle capacity.
Dispatch		Scored candidate selection and atomic acceptance exist, but durable worker matters.
Driver trip execution		Offer, arrive, OTP, complete and earnings flow are implemented.
Live location		Foreground tracking is present; closed-app tracking remains runtime-dependent.
OTP		Start and end OTP gates are implemented with admin and bypass controls.
Notifications		Infrastructure is strong, but device/runtime delivery remains environment-dependent.
Admin operations		Broad operational coverage exists across trips, drivers and finance.
Finance		Wallet, settlement, payment review and subscription logic are implemented.
Commission		Core logic exists, but commission rules contain a documented mismatch.
Receipts		Customer and admin receipt access exists.
Native mobile integration		Split Capacitor shells are present; real-device delivery still matters.
Support and safety		OTP, review, chat, audit trail and location visibility are present.

35. Confirmed, Partial and Runtime-Dependent Capabilities

MOOVU System Design & Product Specification

1.0 • 6 August 2026

Some capabilities are confirmed directly from source and surrounding documentation, while others depend on environment, migration or real-device verification.

CONFIRMED

- Customer booking and fare calculation services
- Driver onboarding flow
- Admin payment review logic
- OTP trip controls
- Receipt routes
- Subscription pricing and approval logic

PARTIAL OR INCONSISTENT

- Commission percentage consistency
- Go XL versus Go Plus naming consistency
- Dispatch expiry timing documentation versus code
- Some operational tables depend on migration alignment

RUNTIME-DEPENDENT

- Closed-app push notification delivery
- Background location continuity on native devices
- Storage and signed URL policy behaviour in real environments
- Fully authenticated dashboard screenshots with real data

Implemented Behaviour

The platform contains a small number of business-rule or naming mismatches that should be tracked explicitly rather than obscured.

PRC MOOVU System Integration & Deployment	PRC MOOVU System Integration & Deployment	PRC MOOVU System Integration & Deployment	PRC MOOVU System Integration & Deployment
PRC MOOVU System Integration & Deployment	PRC MOOVU System Integration & Deployment	PRC MOOVU System Integration & Deployment	PRC MOOVU System Integration & Deployment
Commission	Single agreed MOOVU commission rule	9.5% fallback constant plus 10% / 12% ride-option rules	Historical or fallback rows may diverge from current ride-option pricing
Ride naming	One larger ride-category name	MOOVU Go XL in fare surfaces and Go Plus in some eligibility labels	Terminology drift
Dispatch expiry	One agreed trip search timeout	180 seconds in code, different narrative in operations notes	Operational expectation mismatch
Background operations	Continuous device delivery and telemetry	Foreground flows are implemented, but background or closed-app behaviour depends on runtime capabilities	Requires environment validation

37. Operational Playbooks

The operating model is practical and role-driven. Each recurring operational scenario has a clear owner and result.

New driver onboarding	Admin	Review application, documents, vehicle data, then approve or request corrections.
Daily driver readiness	Operations / dispatcher	Check subscription, online status, GPS freshness and blocked balances.
Customer booking support	Support	Review trip record, dispatch state, location data and customer messages.
No-driver trip handling	Dispatcher	Check candidate pool, radius, eligibility, recent declines and trip age.
Active-trip intervention	Admin / support	Review trip status, OTP state, trip events and location freshness.
Subscription approval	Payment reviewer	Review payment proof, approve, activate plan and notify driver.
Commission-payment approval	Payment reviewer	Review payment proof, settle wallet, issue receipt path and notify driver.
Driver account restriction	Admin	Deactivate or suspend status and document reason.
Trip cancellation review	Support / admin	Inspect status, timestamps, cancellation reason and fees.
End-of-day operations review	Owner / admin	Review trips, payments, subscriptions, blocked balances and issues.

TERM	MEANING
Dispatch	The trip assignment process that searches for eligible drivers and sends offers.
Trip offer	A timed assignment opportunity sent to eligible online drivers.
Search cycle	A dispatch round with a set radius and offer window.
MOOVU Go MOOVU • Customer • Driver • Dispatch • Operations	The base ride category for up to three riders. 0
MOOVU Go XL / Go Plus	The larger-capacity ride category for up to six riders; naming differs across surfaces.
Final fare	The customer fare after distance, duration, stops, surge, discounts and end-of-trip finalization.
Wallet balance	Driver commission balance still owed to MOOVU.
Settlement	A driver commission payment accepted by MOOVU.
FCM token	The push-registration token used to send Firebase notifications to devices.
GPS freshness	Whether the driver heartbeat is recent enough to trust for dispatch or trip actions.

39. at MOOVU Currently Does

MOOVU System Design & Product Specification

1.0 • 6 August 2026

MOOVU currently provides a full booking-to-operations cycle that joins customer requests, driver execution and admin oversight.

MOOVU lets a rider create an account, request a ride, choose a ride category, see a fare estimate, wait for a driver, verify the trip through OTP, chat when a driver is assigned, and receive a receipt afterward. The same platform also lets drivers apply, be reviewed, manage subscriptions, receive offers, execute the ride, and track what they owe MOOVU or what they earned from completed trips.

On the business side, MOOVU gives administrators visibility into trips, applications, payment proof, receipts, driver status, notifications, subscriptions and commission settlement. That makes the application usable not only by riders and drivers, but by the operating business that must keep the network healthy.

The platform works by coordinating structured web and native-ready interfaces with server-side validation, stored records, and timed operational logic.

Does It

MOOVU uses structured server routes to receive trip requests, calculate prices, persist records, trigger dispatch, record trip events, and notify the correct audience. It stores customer, driver, trip, finance and notification state in Supabase, while Google Maps provides location intelligence and Firebase handles visible push notifications.

Driver and admin access are protected by role and ownership checks, not by client navigation alone. That means a booking, offer acceptance, payment review or completion action is meaningful only after the server confirms the user and the relevant trip or driver relationship.

41. MOOVU Explained from Beginning to End

MOOVU System Design & Protocol Specification

1.0 • 6 August 2026

The sequence below explains the whole operating system in one continuous narrative.

1. A customer joins MOOVU, accepts legal terms, and provides trip details.
2. A driver applies through onboarding, including identity and vehicle information.
3. An admin reviews the application and approves a driver for operations.
4. The driver pays a subscription plan and waits for admin approval.
5. The driver goes online once subscription and balance rules allow it.
6. The customer books a ride with pickup, destination, optional stops and ride category.
7. The server calculates the fare, creates the trip record, and starts dispatch.
8. Dispatch searches for eligible drivers, scores them, and offers the trip.
9. A driver accepts, the system assigns the trip atomically, and the customer is notified.
10. The driver reaches pickup, passes the arrival rule and prepares to start the trip.
11. The start OTP is entered so the trip can transition to ongoing.
12. The ride proceeds, with live status, messages and route context available.
13. Stops and actual route conditions can influence the final price before completion.
14. The end OTP is entered, minimum duration is checked, and the trip completes.
15. The final fare is stored, commission is applied, driver net is calculated, and receipts become available.
16. The admin system continues to oversee payments, subscriptions, commissions and exception handling.
17. Notifications connect all participants through the lifecycle where device and runtime support allow.

RIDE OPTION	KEY PRICING
MOOVU Go	R15 base, R9/km, R1.50/min, R40 minimum, R2/min after 3 free minutes
MOOVU Go XL	R25 base, R12/km, R2.00/min, R70 minimum, R3/min after 3 free minutes

- Approved or active driver status
- Verified review state where applicable
- Profile completed
- Subscription active and not expired
- Balance due below R100 lock threshold
- Online and not busy
- GPS available and heartbeat fresh
- Vehicle capacity matches ride option
- No conflicting active trip or active offer
- Driver has not already declined this trip

DOCUMENT GROUP	INCLUDED ITEMS
Identity	SA ID or passport, driver licence, profile photo, proof of residence
Operational	PDP / PrDP where available, police clearance where supported, transport permit where supported
Vehicle	Vehicle registration, licence disc, roadworthy certificate, insurance proof
Visual evidence	Front, back, left, right, interior and number plate photos

PLAN	AMOUNT	DURATION
Daily	R45	1 day
Weekly	R100	7 days
Monthly	R250	30 days

STATUS	MEANING
scheduled	Future trip waiting for release window
requested	Current trip waiting for dispatch
offered	Offer in progress
assigned	Accepted by one driver
arrived	Driver has reached pickup
ongoing	Trip is active after start OTP
completed	Trip ended and final fare was applied
cancelled	Trip ended without completion

EVENT	CUSTOMER	DRIVER	ADMIN	DELIVERY	DESTINATION
New trip request	No	Yes	Yes	FCM / web push	Driver portal and admin trip oversight
Driver accepted trip	Yes	No	Yes	FCM / web push	Customer ride view and admin dispatch
Driver arrived	Yes	No	Optional	FCM / web push	Customer ride view
Trip started	Yes	Optional	Optional	FCM / web push	Customer ride view
Trip completed	Yes	Yes	Yes	FCM / web push	Customer ride view, driver history, admin trips
Customer chat message	No	Yes	No	FCM / web push	Driver live trip context
Driver chat reply	Yes	No	No	FCM / web push	Customer live trip context
Subscription payment submitted	No	No	Yes	FCM / web push	Admin payment reviews
Commission payment submitted	No	No	Yes	FCM / web push	Admin payment reviews
Payment approved or rejected	No	Yes	No	FCM / web push	Driver earnings and receipts

Role and Permission Matrix

ROLE	PRIMARY PERMISSION	RESTRICTION
Visitor	Can access public landing, legal pages, and customer or driver entry points	No trip or protected data access
Customer	Can create bookings, track trips, use OTP, chat, rate, and view receipts	Cannot access driver or admin operations
Driver applicant	Can create a driver account and submit onboarding data	Cannot receive trips until approved and eligible
Approved driver	Can log in, go online, receive offers, execute trips, and manage earnings	Cannot use admin operational tools
Administrator	Can review trips, drivers, receipts, and payments	Requires approved admin role in profiles table
Dispatcher	Operational dispatch visibility and intervention	Subset of admin roles
Support	Operational and customer support visibility	Subset of admin roles
Payment reviewer	Reviews subscription, commission and combined driver payments	Admin-protected workflow
Owner	Highest administrative authority	Role-based, not separate app surface

PLAYBOOK	OWNER	ACTION
New driver onboarding	Admin	Review application, documents, vehicle data, then approve or request corrections.
Daily driver readiness	Operations / dispatcher	Check subscription, online status, GPS freshness and blocked balances.
Customer booking support	Support	Review trip record, dispatch state, location data and customer messages.
No-driver trip handling	Dispatcher	Check candidate pool, radius, eligibility, recent declines and trip age.
Active-trip intervention	Admin / support	Review trip status, OTP state, trip events and location freshness.
Subscription approval	Payment reviewer	Review payment proof, approve, activate plan and notify driver.
Commission-payment approval	Payment reviewer	Review payment proof, settle wallet, issue receipt path and notify driver.
Driver account restriction	Admin	Deactivate or suspend status and document reason.
Trip cancellation review	Support / admin	Inspect status, timestamps, cancellation reason and fees.
End-of-day operations review	Owner / admin	Review trips, payments, subscriptions, blocked balances and issues.
